...

Thanks Davis. The key question is whether the new sample locations are truly representative of the older sample locations. The sampling objectives clearly aren't - the 2002 data were focused on (high concentration) source identification and subsequent sampling efforts were generally designed to delineate the (lower concentration) edges of the source areas among other things. If the 2014 locations were randomly located, than a comparison cannot be made. Same goes for the fish sampling. It's also important to compare penetration depths of the grab samples. The LWG used a weighted, mechanical clam shell sampler with a target penetration depth of 30 cms. Not sure what was used in the 2014 study.

BTW, here is a similar assessment the LWG did in their draft FS.

I will look for the CD enclosure.

Thanks,

Davis Zhen

I think this is part of the information some parties want us to review. I've also forwarded to Sean. We'll need to figure out what a response should be.

Ms. Grandinetti, you will be receiving a package Monday morning from a small group of Portland Harbor Superfund site parties. I have attached a pdf of the cover letter. Our group looks forward to meeting with you to discuss this in detail.

Sincerely,

Dave Roberson, P.E.
